Fairness

Online fairness criteria

Lemma

No envy implies proportionality.

The problem setting

Algorithms

Variations 000 Ending 000

Fairness

Online fairness criteria

Lemma

No envy implies proportionality.

Lemma

No online cake cutting algorithm is proportional, envy-free, or equitable

Proof.

Suppose agent *i* leaves before agent *n* arrives. A_i is then independent of v_n . If $v_n(A_i) = 1$, agent *n* will not value any allocation outside A_i . So, not proportional. Since no envy implies proportionality, not envy-free either.

Suppose allocation was equitable, so all agents receive some cake. Again, A_i is independent of v_n for the first leaving agent i.

The problem setting

Cut-and-choose algorithm

Algorithm 1 | cut but you choose

- 1: procedure Cut-and-choose
- 2: **for** $j = 1 \rightarrow n-1$ rounds **do**
- 3: The earliest arriving agent cuts the cake into two disjoint intervals X, Y such that $v_i(X) = v_{i+1}(Y)$ and $X \sqcup Y = I_i$.
- 4: The second earliest arriving agent j+1 chooses whether to take X and leave, or give X to the cutting agent who leaves.
- 5: $I_{j+1} \leftarrow Y$.
- 6: end for
- 7: The last remaining agent takes the leftover cake.
- 8: end procedure

The problem setting

Algorithms

Variations 000 Ending 000

Fairness of cut-and-choose

Lemma

The online cut-and-choose procedure is weakly proportional and immediately envy free. However, it is not weakly envy free, equitable, or arrival monotonic.

Proof.

Suppose agent *i* cuts a slice c_i . If allocated the slice, they would want $v_i(c_i) \ge r/k$. But, if not allocated this piece, they would want $v_i(c_i) \le r/k$. Thus, the best option is to choose $v_i(c_i) = r/k$.

By generalization, this holds for all i, so this is weakly proportional. Also, trivially immediately envy-free.

Consider the following counter-example with 4 agents in the order $1 \rightarrow 2 \rightarrow 3 \rightarrow 4$ for the negative results.

Theorem

Consider a set S and n agents, and let U be a σ -algebra on S. Suppose each agent j has a countably-additive and nonatomic value measure $v_i : U \to \mathbb{R}$. Let K be a k-partition of S. Then, the set of all $n \times k$ matrices $[M]_{ij}$ is a compact and convex set in the space of all real-valued $n \times k$ matrices.
